## INFORMATION

### *Tropheryma whipplei* diagnostics

Dear colleague,

Thank you for your interest in the molecular biological detection of ***Tropheryma whipplei***.

For optimal analysis results, please send 3-4 biopsies per location, or 2 ml cerebrospinal fluid or joint puncture fluid to the address given in the sample analysis order.

Transportation is optimal at 4°C; therefore, we recommend shipping the samples with a cool pack from the freezer.

Preliminary results of the analysis are usually available within three working days after sample arrival. Please understand that for the final report we may need more time since this sometimes requires sequencing.

In urgent cases, please let us know by phone or E-mail in advance about your sample so that we can prepare a fast work-up.

**In case of positive results, we will contact you promptly.**

In selected cases (primarily sterile tissue such as brain biopsies or heart valves, course of therapy), we have the option of also carrying out fluorescence in situ hybridization (FISH) in order to detect the pathogen directly in the tissue. We offer this examination after consultation with you.

Kind regards,

A handwritten signature in blue ink that reads "Annette Moter".
